# Trac Reports

The Trac reports module provides a simple, yet powerful reporting facility to present information about tickets in the Trac database.

Rather than have its own report definition format, TracReports relies on standard SQL SELECT statements for custom report definition.

**Note:** The report module is being phased out in its current form because it seriously limits the ability of the Trac team to make adjustments to the underlying database schema. We believe that the <u>query module</u> is a good replacement that provides more flexibility and better usability. While there are certain reports that cannot yet be handled by the query module, we intend to further enhance it so that at some point the reports module can be completely removed. This also means that there will be no major enhancements to the report module anymore.

You can already completely replace the reports module by the query module simply by disabling the former in trac.ini:

```
[components]
trac.ticket.report.* = disabled
```

This will make the query module the default handler for the "View Tickets" navigation item. We encourage you to try this configuration and report back what kind of features of reports you are missing, if any.

A report consists of these basic parts:

- ID Unique (sequential) identifier
- Title Descriptive title
- Description A brief description of the report, in <u>WikiFormatting</u> text.
- Report Body List of results from report query, formatted according to the methods described below.
- Footer Links to alternative download formats for this report.

## Changing Sort Order

Simple reports - ungrouped reports to be specific - can be changed to be sorted by any column simply by clicking the column header.

If a column header is a hyperlink (red), click the column you would like to sort by. Clicking the same header again reverses the order.

#### Changing Report Numbering

There may be instances where you need to change the ID of the report, perhaps to organize the reports better. At present this requires changes to the trac database. The report table has the following schema (since 0.10):

- id integer PRIMARY KEY
- author text
- title text
- query text
- description text

Changing the ID changes the shown order and number in the Available Reports list and the report's perma-link. This is done by running something like:

update report set id=5 where id=3;

Keep in mind that the integrity has to be maintained (i.e., ID has to be unique, and you don't want to exceed the max, since that's managed by SQLite someplace).

You may also need to update or remove the report number stored in the report or query.

### Navigating Tickets

Clicking on one of the report results will take you to that ticket. You can navigate through the results by clicking the Next Ticket or Previous Ticket links just below the main menu bar, or click the Back to Report link to return to the report page.

You can safely edit any of the tickets and continue to navigate through the results using the Next/Previous/Back to Report links after saving your results, but when you return to the report, there will be no hint about what has changed, as would happen if you were navigating a list of tickets obtained from a query (see <u>TracQuery#NavigatingTickets</u>). (since 0.11)

### Alternative Download Formats

Aside from the default HTML view, reports can also be exported in a number of alternative formats. At the bottom of the report page, you will find a list of available data formats. Click the desired link to download the alternative report format.

#### Comma-delimited - CSV (Comma Separated Values)

Export the report as plain text, each row on its own line, columns separated by a single comma (','). Note: The output is fully escaped so carriage returns, line feeds, and commas will be preserved in the output.

#### Tab-delimited

Like above, but uses tabs (\t) instead of comma.

#### **RSS - XML Content Syndication**

All reports support syndication using XML/RSS 2.0. To subscribe to an RSS feed, click the orange 'XML' icon at the bottom of the page. See TracRss for general information on RSS support in Trac.

## Creating Custom Reports

Creating a custom report requires a comfortable knowledge of SQL.

A report is basically a single named SQL query, executed and presented by Trac. Reports can be viewed and created from a custom SQL expression directly in the web interface.

Typically, a report consists of a SELECT-expression from the 'ticket' table, using the available columns and sorting the way you want it.

#### Ticket columns

The ticket table has the following columns:

- id
- type
- time
- changetime
- component
- severity
- priority
- owner
- reporter
- CC
- version
- milestone
- status
- resolution
- summary
- description
- keywords

See TracTickets for a detailed description of the column fields.

#### Example: All active tickets, sorted by priority and time

SELECT id AS ticket, status, severity, priority, owner, time AS created, summary FROM ticket

WHERE status IN ('new', 'assigned', 'reopened') ORDER BY priority, time
Advanced Reports: Dynamic Variables
For more flexible reports, Trac supports the use of <i>dynamic variables</i> in report SQL statements. In short, dynamic variables are <i>special</i> strings that are replaced by custom data before query execution.
Using Variables in a Query
The syntax for dynamic variables is simple, any upper case word beginning with '\$' is considered a variable.
Example:
SELECT id AS ticket, summary FROM ticket WHERE priority=\$PRIORITY
To assign a value to \$PRIORITY when viewing the report, you must define it as an argument in the report URL, leaving out the leading '\$'.
Example:
http://trac.edgewall.org/reports/14?PRIORITY=high
To use multiple variables, separate them with an '&'.
Example:
http://trac.edgewall.org/reports/14?PRIORITY=high&SEVERITY=critical
Special/Constant Variables
There is one dynamic variable whose value is set automatically (the URL does not have to be changed) to allow practical reports.
\$USER — Username of logged in user.
Example (List all tickets assigned to me):
SELECT id AS ticket, summary FROM ticket WHERE owner=\$USER
Advanced Reports: Custom Formatting
Trac is also capable of more advanced reports, including custom layouts, result grouping and user-defined CSS styles. To create such reports, we'll use specialized SQL statements to control the output of the Trac report engine.
Special Columns

To format reports, TracReports looks for 'magic' column names in the query result. These 'magic' names are processed and affect the layout and style of the final report.

# Automatically formatted columns

- ticket Ticket ID number. Becomes a hyperlink to that ticket.
- id same as ticket above when realm is not set
- realm together with id, can be used to create links to other resources than tickets (e.g. a realm of *wiki* and an *id* to a page name will create a link to that wiki page)
- created, modified, date, time Format cell as a date and/or time.
- description Ticket description field, parsed through the wiki engine.

<pre>stample: SILECT 11 A3 Licket, created, status, summary FROM Licket These columns can also be defined but marked as hidden, see below. See EnrowWicCodBookConfugurationRegorgs for some example of creating reports for mains other than Acket. Custom formatting columns Columns whose names begin and end with 2 underscores (Example:ealor) are assumed to be formatting hints, affecting the appearance of the row. •group Found be a underscore (Example:ealor) are assumed to be formatting hints, affecting the appearance of the row. •group Bould be a underscore (Example:ealor) are assumed to be formatting hints, affecting the appearance of the row. •group Bould be a underscore values raing from the 15 to select a pre-defined row color. Typically used to color rows by issue priority.</pre>	<b>F</b> ormula
These columns can also be defined but marked as hidden, see balow. See This while CookBook Configuration Reports for some example of creating reports for realms other than bloket. Custom formatting columns Columns whose names begin and end with 2 underscores (Example:ooler) are assumed to be formatting hints, affecting the appearance of the row. *groupfrom presults based on values in this column. Each group will have its own header and table. *groupShould be a numeric value ranging from 1 to 5 to solect a pro-defined row color. Typically used to color rows by issue priority. Default: Scient ColerShould be a numeric value ranging from 1 to 5 to solect a pro-defined row color. Typically used to color rows by issue priority. Default: Scient Coler	Example:
<pre>Set Uncoversity CookBook Configuration/Reports for some example of creating reports for realms other than licket. Custom formatting columns Custom formatting columnsgroup Group results based on values in this column. Each group will have its own header and table. +group Group results based on values in this column. Each group will have its own header and table. +group Group results based on values in this column. Each group will have its own header and table. +group Group results based on values in this column. Each group will have its own header and table. +group Group results based on values in this to be appended URL. The URL is taken from the first row of each group</pre>	SELECT id AS ticket, created, status, summary FROM ticket
Custom formatting columns Columns whose names begin and end with 2 underscores [Example:color_] are assumed to be formatting hints, affecting the appearance of the row. groupGroup results based on values in this column. Each group will have its own header and tablegroupShould be a numeric value ranging from 1 to 5 to selected a pre-defined row color. Typically used to color rows by issue priority	Those columns can also be defined but marked as hidden, see <u>below</u> .
Columns whose names begin and end with 2 underscores (Example:color) are assumed to be formatting hints, affecting the appearance of the row.  •groupGroup results based on values in this column. Each group will have its own header and table.  •group	See <a>trac:wiki/CookBook/Configuration/Reports</a> for some example of creating reports for realms other than ticket.
<pre>cw.    </pre>	Custom formatting columns
<ul> <li></li></ul>	
<pre>SELECT p.value AScolor, t.milestone ASgroup, '/milestone'    t.milestone ASgrouplink, (CASS owner WHEN 'daniel' THEN 'font-weight: bold; background: red;' ELSE '' END) ASstyle, t.id AS ticket t, summary FROM ticket t, summary</pre>	<ul> <li>grouplink — Make the header of each group a link to the specified URL. The URL is taken from the first row of each group.</li> <li>color — Should be a numeric value ranging from 1 to 5 to select a pre-defined row color. Typically used to color rows by issue priority.</li> <li>Defaults: Color 1 Color 2 Color 3 Color 4 Color 5</li> </ul>
<pre>t.milestone ASgroup, './milestone/'    t.milestone ASgrouplink, (CASE owner WHEN 'danle1' THEN 'font-weight: bold; background: red;' ELSE '' END) ASstyle, t.id AS ticket, summary FROM ticket t.enum p WHERE t.status IN ('new', 'assigned', 'reopened') AND p.namest.priority AND p.types'priority' ORDER BY t.milestone, p.value, t.severity, t.time Note: A table join is used to match <i>ticket</i> priorities with their numeric representation from the <i>enum</i> table. Changing layout of report rows By default, all columns on each row are display on a single row in the HTML report, possibly formatted according to the descriptions above. However, it's also possible to create multi-line report entries. • column <i>Break row after this</i>. By appending an underscore (_) to the column name, the remaining columns will be continued on a second line. •column <i>Full</i> row. By adding an underscore (_) to a column name, the remaining columns will be continued on a second line. •column <i>Hide</i> data. Prepending an underscore (_) to a column name, the remaining columns will be continued on a separate row. •column - <i>Hide</i> data. Prepending an underscore (_) to a column name instructs Trac to hide the contents from the HTML output. This is useful for information to be visible only if downloaded in other formats (like CSV or RSS/XML). This can be used to hide any kind of column, even important ones required for identifying the resource, e.g. id asid will hide the ld column but the link to the ticket will be present. Example: List active tickets, grouped by milestone, colored by priority, with description and multi-line layout SELECT p.value AScolor, t.milestone ASgroup_, (CASE owner WHEN 'daniel' THEN 'font-weight: bold; background: red;' ELESE '' END) ASstyle_, t.id AS ticket, summary AS summary_, ## Break line here component, version, severity, milestone, status, owner, time AS created, changetine AS modified, ## Dates are formatted description ASdescription_, ## Dates are formatted</pre>	Example: List active tickets, grouped by milestone, group header linked to milestone page, colored by priority
Changing layout of report rows By default, all columns on each row are display on a single row in the HTML report, possibly formatted according to the descriptions above. However, it's also possible to create multi-line report entries.  • column_ — Break row after this. By appending an underscore ('_) to the column name, the remaining columns will be continued on a second line.  •column_ — Full row. By adding an underscore ('_) both at the beginning and the end of a column name, the data will be shown on a separate row.  •column_ — Hide data. Prepending an underscore ('_) to a column name instructs Trac to hide the contents from the HTML output. This is useful for information to be visible only if downloaded in other formats (like CSV or RSS/XML). This can be used to hide any kind of column, even important ones required for identifying the resource, e.g. id as _id will hide the Id column but the link to the ticket will be present. Example: List active tickets, grouped by milestone, colored by priority, with description and multi-line layout SELECT p.value AScolor,         (CASE owner	<pre>t.milestone ASgroup, '/milestone/'    t.milestone ASgrouplink, (CASE owner WHEN 'daniel' THEN 'font-weight: bold; background: red;' ELSE '' END) ASstyle, t.id AS ticket, summary FROM ticket t,enum p WHERE t.status IN ('new', 'assigned', 'reopened') AND p.name=t.priority AND p.type='priority'</pre>
Changing layout of report rows By default, all columns on each row are display on a single row in the HTML report, possibly formatted according to the descriptions above. However, it's also possible to create multi-line report entries.  • column_ — Break row after this. By appending an underscore ('_) to the column name, the remaining columns will be continued on a second line.  •column_ — Full row. By adding an underscore ('_) both at the beginning and the end of a column name, the data will be shown on a separate row.  •column_ — Hide data. Prepending an underscore ('_) to a column name instructs Trac to hide the contents from the HTML output. This is useful for information to be visible only if downloaded in other formats (like CSV or RSS/XML). This can be used to hide any kind of column, even important ones required for identifying the resource, e.g. id asid will hide the Id column but the link to the ticket will be present. Example: List active tickets, grouped by milestone, colored by priority, with description and multi-line layout SELECT p.value AScolor,	Note: A table join is used to match <i>ticket</i> priorities with their numeric representation from the <i>enum</i> table.
By default, all columns on each row are display on a single row in the HTML report, possibly formatted according to the descriptions above. However, it's also possible to create multi-line report entries. • column_ — <i>Break row after this.</i> By appending an underscore ('_) to the column name, the remaining columns will be continued on a second line. •column_ — <i>Full row.</i> By adding an underscore ('_) both at the beginning and the end of a column name, the data will be shown on a separate row. •column — <i>Hide data.</i> Prepending an underscore ('_) to a column name instructs Trac to hide the contents from the HTML output. ORDER BY t.milestone, p.value, t.severity, t.time	<pre>t.milestone ASgroup, (CASE owner</pre>

#### Reporting on custom fields

If you have added custom fields to your tickets (a feature since v0.8, see <u>TracTicketsCustomFields</u>), you can write a SQL query to cover them. You'll need to make a join on the ticket\_custom table, but this isn't especially easy.

If you have tickets in the database before you declare the extra fields in trac.ini, there will be no associated data in the ticket\_custom table. To get around this, use SQL's "LEFT OUTER JOIN" clauses. See TraclniReportCustomFieldSample for some examples.

Note that you need to set up permissions in order to see the buttons for adding or editing reports.
